

1-2 Page Report:

The project I chose was the Tic-Tac-Toe project, where we created a working game of Tic-Tac-Toe in the python console using a list of lists, and fulfilling the given required functions. I chose this because I thought it could be challenging and fun, while also not being overly complex. Tic-tac-toe is a game we all grew up with, so not having to look up the rules is a bonus.

I used mainly if statements to check for various situations, with for loops and while loops spread without. I also frequently used classes and outer functions to simplify the situation as far as possible. Lists are also utilized throughout in order to simplify how the board is read by the code, as well as put it in a well formatted way for the human eye. The input and int functions/codes are also used to take user input and make it able to be used by the code. All user inputs are validated, and there are no errors in the code.

While not being too complex of an issue, it wasn't easy. Figuring out a way to balance the board class I created and use the necessary functions required some workaround, and utilizing these functions while also creating other helper functions was complex, but also very enjoyable. It was nice to clearly see the project progressing in the right direction.

Since I already knew the rules, the hardest part was debugging the nearly finished code. I spent the longest time fixing my winning conditions, as I used a lot of copy and paste of the same line and changing it, then forgetting to change the last line. This caused major issues that I believed were in a different location, which slowed my process down quite a bit.

One improvement I considered adding multiple games as a possibility and keeping track of score, but I didn't want to add anything not specified just in case. It wouldn't be a difficult change, but I didn't want to take any risks. I also had to delete the original project file and upload a new one with comments, as I wasn't sure if editing the uploaded project file would break the code when run from a different source/site.

While the code I wrote isn't very long or complex, it does the job and it does it well. This is my version of tic tac toe with all the necessary requirements met. Thank you for reading this, and I wish you the best.

This project was started on 4/26/26, and finished on 4/27/26.
